

Executive Summary: Employee Attrition Analysis

This analysis identified the main factors linked to employee attrition and highlighted areas where HR can improve retention. The strongest factors were Monthly Income, Age, and Overtime.

Employees with lower income were more likely to leave, showing that pay is an important retention factor. However, income is not the only reason. Age and overtime also play a major role, which means attrition is influenced by several factors.

The Sales department had the highest attrition, especially among employees working overtime. This suggests that workload and pressure may be contributing to turnover. Reducing excessive overtime and improving work-life balance could help retain these employees.

Younger employees were also more likely to leave, while experienced employees bring valuable knowledge to the company. HR should support younger employees with growth opportunities and also recognize and retain experienced staff.

A predictive model was built to help identify employees who may be at risk of leaving. This can help HR act early, but it should support human judgment, not replace it. If an employee is flagged, HR should look into possible concerns such as workload, pay, or career growth.

Recommended actions:

- Review pay for lower-salary employees.
- Reduce unnecessary overtime.
- Focus retention efforts on the Sales team.
- Offer more career growth opportunities for younger employees.
- Use the model to support early HR intervention.

The model shows patterns linked to attrition, but it cannot tell the exact reason an employee leaves. HR conversations and employee feedback are still essential.
